

Talking Rabbitt

Conversational AI for Supply Chain Intelligence

Executive Proposal for Delhivery

Executive Summary

Delhivery operates one of India's largest logistics networks, handling millions of shipments across warehouses, delivery hubs, and regional supply chains. This scale generates massive operational datasets related to shipment volume, warehouse throughput, delivery delays, and route performance.

While modern analytics tools such as dashboards and BI platforms provide access to this data, extracting meaningful insights often requires manual filtering, complex queries, and technical expertise.

Talking Rabbitt introduces a conversational intelligence layer for logistics analytics, enabling operations leaders to interact with their operational data using natural language queries and receive instant insights and visualizations.

The Operational Problem

Logistics operations teams face several challenges when working with large datasets:

- Operational data is spread across dashboards and reporting tools
- Extracting insights requires technical knowledge of analytics platforms
- Manual reporting delays operational decision-making
- Identifying warehouse or route bottlenecks takes significant time

For a large logistics network like Delhivery, these delays can directly impact delivery performance, operational efficiency, and customer satisfaction.

Talking Rabbitt: The Proposed Solution

Talking Rabbitt enables logistics leaders to talk directly to their supply chain data.

Instead of navigating dashboards, managers simply ask questions such as:

- "Which warehouse processed the highest shipments this week?"
- "Which delivery hub has the highest delay rate?"
- "Which region is experiencing increasing delivery delays?"

The platform automatically analyzes uploaded datasets and returns:

- AI-generated insights
- Automated visualizations
- Operational performance comparisons

This reduces a 10-minute dashboard analysis into a 5-second conversation.

Implementation Approach

1. Pilot Deployment

Launch Talking Rabbitt with selected operations teams at Delhivery to validate real-time analytics use cases.

2. Data Integration

Connect Talking Rabbitt with shipment datasets and warehouse performance data.

3. Enterprise Rollout

Scale the platform across logistics operations as a cloud-based AI analytics solution.

Expected Business Impact

Deploying Talking Rabbitt can deliver measurable operational benefits:

- Faster decision-making for operations leaders
- Improved visibility across warehouse and delivery networks
- Faster identification of operational bottlenecks
- Improved supply chain efficiency

By transforming operational datasets into conversational insights, Talking Rabbitt enables logistics teams to focus on decisions rather than dashboards.
